Statement of	Property is lo	ears to meet criteria for the National Regi cated in a potential historic district (Natio entially contributes to a historic district (N	onal and/or local): <u>No</u>	
Statement of Significance	The Evergreen Point Bridge, the second span across Lake Washington, lies 4 miles north of the first floating bridge, the Lacey V. Murrow Memorial Bridge. The Evergreen Point Bridge formed the center portion of the 5.8-mile project connecting the area's two main north-south highways, Interstate 405 on the lake's east side and Seattle's Interstate 5. (Hobbs and Holstine 2005). Construction on the Evergreen Point Bridge began in August 1960 and took almost 3 years (837 days) to complete (Hobbs and Holstine 2005). Its opening ceremony was held August 28, 1963. Although still generally referred to as the Evergreen Point bridge, it was officially renamed the Governor Albert D. Rosellini Bridge in 1988 (Mauldin, n.d.).			
	The floating pontoon bridge design was originally conceived by engineer Homer Hadley and was first used on the Lacey V. Murrow bridge. Charles E. Andrew was chief consulting engineer on the Evergreen Point Bridge for the State Toll Bridge Authority, Ken Arkin was senior field engineer in charge of field engineering for the bridge, and Mike Thomas was design engineer for the structure ("Bridge Offices" 1954). The Project Engineer was Harold S. Sitzman, and the Resident Engineer was John C. Tucker ("Evergreen Point Bridge" nd). The contractor for the floating portion was Guy F. Atkinson, and for the approach structures, the contractors were General Construction Company and Manson Construction and Engineering Company ("Vital Statistics" n.d.).			
	million), making it with a 40-year retin removed. The brid	the most expensive floating bridge in the wo rement limit. The bridge had a 35-cent toll fro	rld at the time (Hobbs and Holstine 2 om 1963 to 1979. In June 1979, the b	at 1.4 miles long. It cost \$24,972,000 (the floating section alone was \$10.9 005). The State Toll Bridge Authority issued a \$30 million bond for the bridge, bond was paid in full (20 years ahead of schedule) and the toll booths were ern Bellevue, Redmond and Kirkland, leading to greatly increased development
	and rehabilitation of bridge, including t	of guide rollers, repair of columns, and misce he replacement of the draw span and the ad	ellaneous electrical and mechanical r Idition of an emergency stop bar in 1	ainting, cable replacement, repair/replacement of expansion joints, replacement ehabilitation. More substantial work was done to increase the safety of the 994, the addition of ladders and catwalks to selected pontoons, and the he appearance, operation or significance of the bridge.
	must handle more	than twice its intended capacity. The bridge	is already over 40 years old, and will	en completed in 1963. It continues to fulfill its original function, although it now meet the 50 year mark for National Register eligibility in August 2013. With the n Point Bridge became the oldest remaining floating bridge across Lake

Historic Pro Inventory Re	
	Washington, exemplifying an engineering feat of outstanding proportions. As noted above, it was also the longest and most expensive at its time of construction. Due to its exceptional importance, the bridge is eligible for the NRHP. It is significant as a structure under Criterion C for its outstanding and innovative engineering design that meets the criteria of exceptional importance. It is also significant under Criterion A for its lasting effect on the development of the Seattle metropolitan area, especially on the communities of the Eastside.
Description of Physical Appearance	The bridge stretches from the Montlake area of Seattle, across Lake Washington to Medina. The floating section of the bridge is 7,578 feet long (1.4 miles), with 33 floating sections and 62 anchors. A standard pontoon measures 360 feet long by 60 feet wide and 14'9" deep, and weighs 4,725 tons. ("Vital Statistics" n.d) The 62 reinforced-concrete anchors each weigh 77 tons and are connected to the pontoons by two ¾-inch steel cables. The roadway accommodates four lanes of traffic and is 54 feet wide. It has a 2–foot-wide median and 3-foot-wide walkway. The Evergreen Point Bridge was designed with a "no bulge" lift-draw span which opens to 200 feet to allow passage of ships. The lift spans are raised 7 feet, allowing retraction of the moveable pontoons. At each end of the floating section, elevated steel truss spans with fixed piers connect to the shore and provide enough vertical clearance to accommodate large pleasure craft (Hobbs and Holstine 2005).

1993). It is likely that this pump house and water tower served the purpose of pumping and storing water for this residence.

The house has had small additions on the rear elevation. The roof structure reflects the evolution of the house, with a front gable on the main section that faces the water, a side or cross gable on the 1932 addition, and another, parallel front gable on the south elevation wing. The rear additions have shed roofs.
